#	Article	IF	CITATIONS
1	A Dual Interaction Between the 5′- and 3′-Ends of the Melon Necrotic Spot Virus (MNSV) RNA Genome Is Required for Efficient Cap-Independent Translation. Frontiers in Plant Science, 2018, 9, 625.	3.6	3
2	Analysis of the interacting partners elF4F and 3′ ITE required for <i>Melon necrotic spot virus</i> capâ€independent translation. Molecular Plant Pathology, 2017, 18, 635-648.	4.2	27
3	Structure of elF4E in Complex with an elF4G Peptide Supports a Universal Bipartite Binding Mode for Protein Translation. Plant Physiology, 2017, 174, 1476-1491.	4.8	32
4	Non-canonical Translation in Plant RNA Viruses. Frontiers in Plant Science, 2017, 8, 494.	3.6	99
5	Structural and Functional Diversity of Plant Virus 3′-Cap-Independent Translation Enhancers (3′-CITEs). Frontiers in Plant Science, 2017, 8, 2047.	3.6	48
6	Determination of the Secondary Structure of an RNA fragment in Solution: Selective 2`-Hydroxyl Acylation Analyzed by Primer Extension Assay (SHAPE). Bio-protocol, 2015, 5, .	0.4	14
7	Interfamilial recombination between viruses led to acquisition of a novel translationâ€enhancing <scp>RNA</scp> element that allows resistance breaking. New Phytologist, 2014, 202, 233-246.	7.3	73
8	Relative incidence, spatial distribution and genetic diversity of cucurbit viruses in eastern Spain. Annals of Applied Biology, 2013, 162, 362-370.	2.5	58
9	A Cost-effective Double-Stranded cDNA Synthesis for Plant Microarrays. Plant Molecular Biology Reporter, 2012, 30, 1276-1282.	1.8	1
10	Melon RNA interference (RNAi) lines silenced for <i>Cmâ€eIF4E</i> show broad virus resistance. Molecular Plant Pathology, 2012, 13, 755-763.	4.2	105
11	<i>Nicotiana benthamiana</i> resistance to nonâ€adapted <i>Melon necrotic spot virus</i> results from an incompatible interaction between virus RNA and translation initiation factor 4E. Plant Journal, 2011, 66, 492-501.	5.7	34
12	Development of expression vectors based on pepino mosaic virus. Plant Methods, 2011, 7, 6.	4.3	62
13	Analysis of expressed sequence tags generated from full-length enriched cDNA libraries of melon. BMC Genomics, 2011, 12, 252.	2.8	49
14	Recessive Resistance to Plant Viruses. Advances in Virus Research, 2009, 75, 119-231.	2.1	206
15	Mechanism of plant elF4Eâ€mediated resistance against a Carmovirus (<i>Tombusviridae</i>): capâ€independent translation of a viral RNA controlled <i>inâ€∫cis</i> by an (a)virulence determinant. Plant Journal, 2008, 56, 716-727.	5.7	76
16	Cucurbit aphid-borne yellows virus Is Prevalent in Field-Grown Cucurbit Crops of Southeastern Spain. Plant Disease, 2007, 91, 232-238.	1.4	55
17	EcoTILLING for the identification of allelic variants of melon eIF4E, a factor that controls virus susceptibility. BMC Plant Biology, 2007, 7, 34.	3.6	123
18	MELOGEN: an EST database for melon functional genomics. BMC Genomics, 2007, 8, 306.	2.8	87

VERONICA TRUNIGER

#	Article	IF	CITATIONS
19	Involvement of the "linker―region between the exonuclease and polymerization domains of Ĩ•29 DNA polymerase in DNA and TP binding. Gene, 2005, 348, 89-99.	2.2	3
20	Function of the C-terminus of Â29 DNA polymerase in DNA and terminal protein binding. Nucleic Acids Research, 2004, 32, 361-370.	14.5	9
21	Advances in understanding recessive resistance to plant viruses. Molecular Plant Pathology, 2004, 5, 223-233.	4.2	157
22	Two Positively Charged Residues of φ29 DNA Polymerase, Conserved in Protein-primed DNA Polymerases, are Involved in Stabilisation of the Incoming Nucleotide. Journal of Molecular Biology, 2004, 335, 481-494.	4.2	9
23	Molecular Characterization of a Melon necrotic spot virus Strain That Overcomes the Resistance in Melon and Nonhost Plants. Molecular Plant-Microbe Interactions, 2004, 17, 668-675.	2.6	68
24	Further variability within the genus Crinivirus, as revealed by determination of the complete RNA genome sequence of Cucurbit yellow stunting disorder virus. Journal of General Virology, 2003, 84, 2555-2564.	2.9	42
25	ϕ29 DNA Polymerase Residue Leu384, Highly Conserved in Motif B of Eukaryotic Type DNA Replicases, Is Involved in Nucleotide Insertion Fidelity. Journal of Biological Chemistry, 2003, 278, 33482-33491.	3.4	4
26	A positively charged residue of phi29 DNA polymerase, highly conserved in DNA polymerases from families A and B, is involved in binding the incoming nucleotide. Nucleic Acids Research, 2002, 30, 1483-1492.	14.5	19
27	A Highly Conserved Lysine Residue in φ29 DNA Polymerase is Important for Correct Binding of the Templating Nucleotide during Initiation of φ29 DNA Replication. Journal of Molecular Biology, 2002, 318, 83-96.	4.2	7
28	The (I/Y)XGG Motif of Adenovirus DNA Polymerase Affects Template DNA Binding and the Transition from Initiation to Elongation. Journal of Biological Chemistry, 2001, 276, 29846-29853.	3.4	13
29	Analysis of Ã~29 DNA polymerase by partial proteolysis: binding of terminal protein in the double-stranded DNA channel 1 1Edited by M. Yaniv. Journal of Molecular Biology, 2000, 295, 441-453.	4.2	8
30	Role of the "YxGG/A―motif of Ã,29 DNA polymerase in protein-primed replication. Journal of Molecular Biology, 1999, 286, 57-69.	4.2	25
31	Ã29 DNA polymerase requires the N-terminal domain to bind terminal protein and DNA primer substrates. Journal of Molecular Biology, 1998, 278, 741-755.	4.2	20
32	Glycerol uptake in Escherichia coli is sensitive to membrane lipid composition. Research in Microbiology, 1993, 144, 565-574.	2.1	21
