#	ARTICLE	IF	CITATIONS
1	Carbon metabolism of soil microbial communities of restored forests in Southern China. <i>Journal of Soils and Sediments</i> , 2011, 11, 789-799.	3.0	29
2	Temporal and spatial variation of water stable isotopes (¹⁸ O and ² H) in the Kaidu River basin, Northwestern China. <i>Hydrological Processes</i> , 2014, 28, 653-661.	2.6	20
3	Carbon input manipulations affecting microbial carbon metabolism in temperate forest soils – A comparative study between broadleaf and coniferous plantations. <i>Geoderma</i> , 2019, 355, 113914.	5.1	13
4	Artificial reforestation produces less diverse soil nitrogen cycling genes than natural restoration. <i>Ecosphere</i> , 2019, 10, e02562.	2.2	13
5	Spatial characteristics of surface water and groundwater using water stable isotope in the Tarim River Basin, northwestern China. <i>Ecohydrology</i> , 2013, 6, 1031-1039.	2.4	12
6	Stabilities of soil organic carbon and carbon cycling genes are higher in natural secondary forests than in artificial plantations in southern China. <i>Land Degradation and Development</i> , 2020, 31, 2986-2995.	3.9	6
7	Forest restoration approaches affect soil compositions of lignin, substituted fatty acids, and lignin degradation-associated genes. <i>Applied Soil Ecology</i> , 2019, 138, 213-219.	4.3	3
8	Microbial functional gene diversity in natural secondary forest Ultisols. <i>Acta Oecologica</i> , 2020, 105, 103575.	1.1	1
9	Data on soil microbial carbon source utilization under different carbon input treatments in broadleaf and coniferous plantations. <i>Data in Brief</i> , 2019, 26, 104434.	1.0	0
